

# Solution Guide: Take Five and Practice the Command Line

---

- First, navigate into the `/03-student/day1/take_5` folder on your VM (virtual machine). To do so, run the following commands:
  - `cd /03-student/day1/`
  - `cd take_5`
- Create a folder called `Internal_Investigation` :
  - `mkdir Internal_Investigation_Employee_A`
- Confirm the folder was created:
  - `ls`
- Navigate into `Internal_Investigation` :
  - `cd Internal_Investigation_Employee_A`
- From within the `Internal_Investigation_Employee_A` folder, print the working directory to confirm you are in the correct location:
  - `pwd`

This should display:

```
/03-student/day1/take_5/Internal_investigation_Employee_A
```

- Create three files inside the `Internal_Investigation_Employee_A` folder: `email_evidence` , `log_evidence` , `web_evidence` :
  - `touch email_evidence log_evidence web_evidence`

We created three files with one command by putting a space between each of the file names. (You can also create them one at a time.)

- Delete the file called `web_evidence` :

- `rm web_evidence`
- Display (list) all the files created:
  - `ls`
- The two files that display are: `email_evidence log_evidence`
- Lastly, clear the terminal window:

- **clear**
