

# Activity File: Using awk

---

- You continue in your role as security analyst at Wonka Corp.
- Your manager still needs your help finding information on the cybercriminal attempting to log into several administrative websites owned by Wonka.
- You are now tasked with isolating several fields from the log file to determine the primary username being used to log in.

## Instructions

Using only the command line, complete the following tasks from within the `/03-student/day3/learning_awk` folder in your Ubuntu VM:

1. Move `Update1_Combined_Access_logs.txt` into the directory `/03-student/day3/learning_awk`.
  - If you didn't have a chance to finish the last activity feel free to use the `Update1_Combined_Access_logs.txt` file located [here](#).
2. Use the `awk` command to isolate the time and username fields out from this file.
3. Use redirection to place these results into a new file called `Update2_Combined_Access_logs.txt`.
